Introduction:

The 25KW high frequency induction heating machine uses a series resonant circuit, the resonant out put low voltage, high current frequency power by high-

frequency transformer; This device is our first generation products, using MOSFET power devices and our first generation variable flow control technology, equipment a very simple structure, high reliability, low maintenance, customer self-

maintenance convenience, is currently one of the most widely used devices

Features:

- 1. Under the same conditions, saving a double electric energy than traditional ones.
- 2.Design with a 100% load, continuously 24 hours a day, can be equipped with infrared temperature measurement, automatic temperature control, improve the heating quality and simplify the manual operation.
- 3. With over-current, over-voltage, underwater, phase failure, load discomfort state, the provision of higher reliability and durability.
- 4. Applied to the workplace with poor environment, you can put the main host machine in clean space , reducing the host's repair rate, increase the reliability of the device.
- 5.Can be used in pipeline operations, the small ext machine occupies a small counter top space, easy to move.

Specifications:

The followings are the normal specifications of our 25KW high frequency induction welding machine:

Parameters	Numerical
Input voltage	Three phase 380V, 50 or 60HZ
Power	25 KW
The operating voltage	340V-430V
Out current	200-1200 A
Work frequency	30-80 KHZ
Rated duty cycle	100%
Temperature of cooling water	≤ 40°C
Cooling water Pressure	0.06Mpa-0.12Mpa
Cooling watering flow	7.3 L/min
Dimensions and Weight	560 × 220 × 590mm

The above specifications are for reference, other or special specifications can be ordered by customer s.

We also has 30kW high frequency induction welding machine and 20kW high frequency induction welding machine
