Comparison of diamond quality and cutting performance:

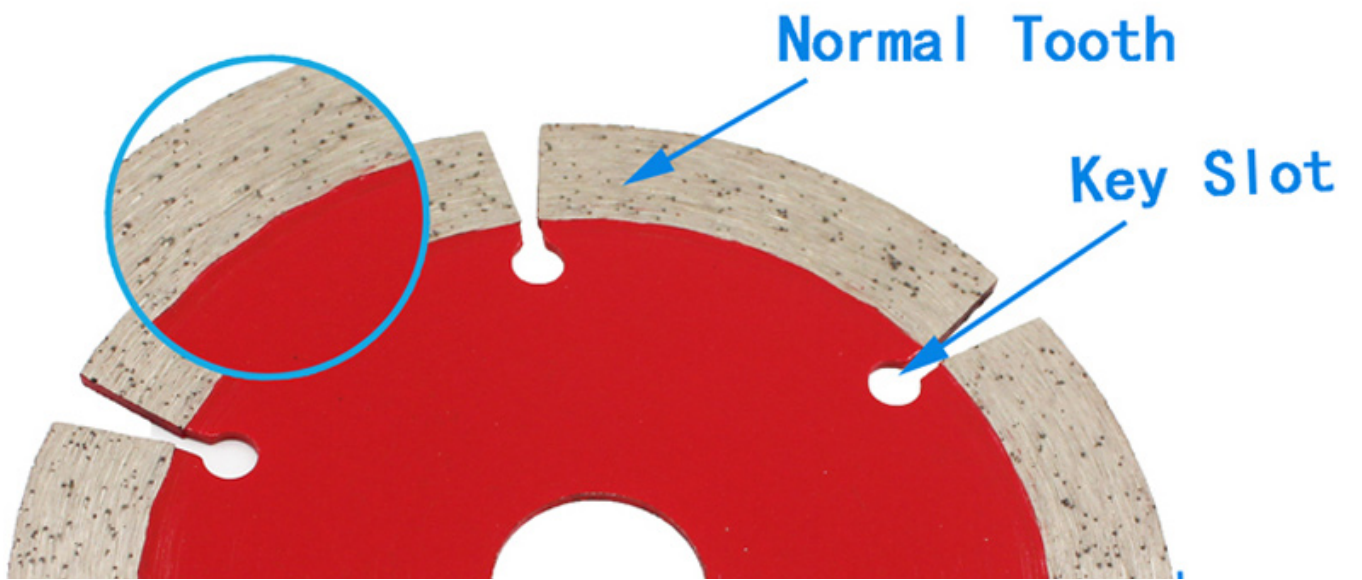

1. High-grade diamond particles are bright yellow and have a sharp, crystalline structure, while low-grade diamond particles are dark and have a more irregular, fragmented structure. High-grade diamond particles are more uniform in size and shape, while low-grade diamond particles are more varied in size and shape.
2. High-grade diamond particles are more resistant to wear and tear, while low-grade diamond particles are more prone to chipping and breaking. High-grade diamond particles are more durable and last longer, while low-grade diamond particles are less durable and wear out faster.
3. High-grade diamond particles provide a smoother and more consistent cutting surface, while low-grade diamond particles provide a rough and uneven cutting surface. High-grade diamond particles are more effective at cutting through hard materials, while low-grade diamond particles are less effective.
4. High-grade diamond particles are more expensive, while low-grade diamond particles are less expensive. High-grade diamond particles are a better investment for long-term use, while low-grade diamond particles are a cheaper option for short-term use.
